- All values valid for 23°C ambient temperature with no pre-energization if not noted otherwise. Refer to diagram for values at other temperatures.
- Requires external coil economization that must start 100-300ms after coil activation. Avoid repetitive switching. Minimum clamp voltage 60V (see circuit recommendation).
- Demagnetization voltage is clamped at 50V (coil 0102) / 70V (coil 0112). External coil suppression is not necessary and could reduce switching capability. Contact TE Connectivity for details.
- 6) Max. rise time 100ms.
- 7)  $2.6\Omega$  coil /  $5.0\Omega$  coil is switched off internally min. 120ms after pull-in.
